Subsetting Data in R

Data Wrangling in R

Overview

We showed one way to read data into R using `read_csv` and `read.csv`. In this module, we will show you how to:

1. Select specific elements of an object by an index or logical condition
2. Renaming columns of a `data.frame`
3. Subset rows of a `data.frame`
4. Subset columns of a `data.frame`
5. Add/remove new columns to a `data.frame`
6. Order the columns of a `data.frame`
7. Order the rows of a `data.frame`

Setup

We will show you how to do each operation in base R then show you how to use the `dplyr` package to do the same operation (if applicable).

Many resources on how to use `dplyr` exist and are straightforward:

- https://cran.rstudio.com/web/packages/dplyr/vignettes/
- https://stat545-ubc.github.io/block009_dplyr-intro.html
- https://www.datacamp.com/courses/dplyr-data-manipulation-r-tutorial

The `dplyr` package also interfaces well with tibbles.

Select specific elements using an index

Often you only want to look at subsets of a data set at any given time. As a review, elements of an R object are selected using the brackets (`[` and `]`).

For example, `x` is a vector of numbers and we can select the second element of `x` using the brackets and an index (2):

```
x = c(1, 4, 2, 8, 10)
x[2]
```

```
[1] 4
```

Select specific elements using an index

We can select the fifth or second AND fifth elements below:

```
x = c(1, 2, 4, 8, 10)
x[5]
```

```
[1] 10
```

```
x[c(2,5)]
```

```
[1]  2 10
```

Subsetting by deletion of entries

You can put a minus (-) before integers inside brackets to remove these indices from the data.

```
x[-2] # all but the second
```

```
[1]  1  4  8 10
```

Note that you have to be careful with this syntax when dropping more than 1 element:

```
x[-c(1,2,3)] # drop first 3
```

```
[1]  8 10
```

```
# x[-1:3] # shorthand. R sees as -1 to 3
x[-(1:3)] # needs parentheses
```

```
[1]  8 10
```

Select specific elements using logical operators

What about selecting rows based on the values of two variables? We use logical statements. Here we select only elements of **x** greater than 2:

```
x
```

```
[1]  1  2  4  8 10
```

```
x > 2
```

```
[1] FALSE FALSE  TRUE  TRUE  TRUE
```

```
x[ x > 2 ]
```

```
[1]  4  8 10
```

Select specific elements using logical operators

You can have multiple logical conditions using the following:

- `&` : AND
- `|` : OR

```
x[ x > 2 & x < 5 ]
```

```
[1] 4
```

```
x[ x > 5 | x == 2 ]
```

```
[1]  2  8 10
```

which function

The `which` functions takes in logical vectors and returns the index for the elements where the logical value is `TRUE`.

```
which(x > 5 | x == 2) # returns index
```

```
[1] 2 4 5
```

```
x[ which(x > 5 | x == 2) ]
```

```
[1]  2  8 10
```

```
x[ x > 5 | x == 2 ]
```

```
[1]  2  8 10
```

Creating a `data.frame` to work with

Here we use one of the datasets that comes with R called `mtcars` create a toy data.frame named `df` using random data:

```
data(mtcars)
df = mtcars
tbl = as.tbl(df)
```

Renaming Columns

Renaming Columns of a `data.frame`: base R

We can use the `colnames` function to directly reassign column names of `df`:

```
colnames(df)[1:3] = c("MPG", "CYL", "DISP")
head(df)
```

```
                   MPG CYL DISP  hp drat    wt  qsec vs am gear carb
Mazda RX4         21.0   6  160 110 3.90 2.620 16.46  0  1    4    4
Mazda RX4 Wag     21.0   6  160 110 3.90 2.875 17.02  0  1    4    4
Datsun 710        22.8   4  108  93 3.85 2.320 18.61  1  1    4    1
Hornet 4 Drive    21.4   6  258 110 3.08 3.215 19.44  1  0    3    1
Hornet Sportabout 18.7   8  360 175 3.15 3.440 17.02  0  0    3    2
Valiant           18.1   6  225 105 2.76 3.460 20.22  1  0    3    1
```

```
colnames(df)[1:3] = c("mpg", "cyl", "disp") #reset
```

Renaming Columns of a `data.frame`: base R

We can assign the column names, change the ones we want, and then re-assign the column names:

```
cn = colnames(df)
cn[ cn == "drat"] = "DRAT"
colnames(df) = cn
head(df)
```

```
                   mpg cyl disp  hp DRAT    wt  qsec vs am gear carb
Mazda RX4         21.0   6  160 110 3.90 2.620 16.46  0  1    4    4
Mazda RX4 Wag     21.0   6  160 110 3.90 2.875 17.02  0  1    4    4
Datsun 710        22.8   4  108  93 3.85 2.320 18.61  1  1    4    1
Hornet 4 Drive    21.4   6  258 110 3.08 3.215 19.44  1  0    3    1
Hornet Sportabout 18.7   8  360 175 3.15 3.440 17.02  0  0    3    2
Valiant           18.1   6  225 105 2.76 3.460 20.22  1  0    3    1
```

```
colnames(df)[ colnames(df) == "DRAT"] = "drat" #reset
```

Renaming Columns of a `data.frame`: dplyr and tidyverse

```
library(tidyverse)
```

```
-- Attaching packages ---------------------------------- tidyverse 1.2.1 --
```

```
v ggplot2 3.0.0     v readr   1.1.1
v tibble  1.4.2     v purrr   0.2.5
v tidyr   0.8.1     v stringr 1.3.1
v ggplot2 3.0.0     v forcats 0.3.0
```

```
-- Conflicts ------------------------------------- tidyverse_conflicts() --
x dplyr::filter() masks stats::filter()
x dplyr::lag()    masks stats::lag()
```

Note, when loading `dplyr`, it says objects can be "masked"/conflicts. That means if you use a function defined in 2 places, it uses the one that is loaded in **last**.

Renaming Columns of a `data.frame`: dplyr

For example, if we print `filter`, then we see at the bottom `namespace:dplyr`, which means when you type `filter`, it will use the one from the `dplyr` package.

```
filter
```

```
function (.data, ...)
{
    UseMethod("filter")
}
<bytecode: 0x000000000d0e2000>
<environment: namespace:dplyr>
```

Renaming Columns of a `data.frame`: dplyr

A `filter` function exists by default in the `stats` package, however. If you want to make sure you use that one, you use `PackageName::Function` with the colon-colon ("`::`") operator.

```
head(stats::filter,2)
```

```
1 function (x, filter, method = c("convolution", "recursive"),
2     sides = 2L, circular = FALSE, init = NULL)
```

This is important when loading many packages, and you may have some conflicts/masking:

Renaming Columns of a `data.frame`: dplyr

To rename columns in `dplyr`, you use the `rename` command

```
df = dplyr::rename(df, MPG = mpg)
head(df)
```

```
                  MPG cyl disp  hp drat    wt  qsec vs am gear carb
Mazda RX4        21.0   6  160 110 3.90 2.620 16.46  0  1    4    4
Mazda RX4 Wag    21.0   6  160 110 3.90 2.875 17.02  0  1    4    4
Datsun 710       22.8   4  108  93 3.85 2.320 18.61  1  1    4    1
Hornet 4 Drive   21.4   6  258 110 3.08 3.215 19.44  1  0    3    1
Hornet Sportabout 18.7   8  360 175 3.15 3.440 17.02  0  0    3    2
Valiant          18.1   6  225 105 2.76 3.460 20.22  1  0    3    1
```

```
df = rename(df, mpg = MPG) # reset - don't need :: b/c not masked
```

Subsetting Columns

Subset columns of a `data.frame`:

We can grab the `carb` column using the `$` operator.

```
df$carb
```

```
 [1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
```

Subset columns of a `data.frame`:

We can also subset a `data.frame` using the bracket `[, ]` subsetting.

For `data.frame`s and matrices (2-dimensional objects), the brackets are `[rows, columns]` subsetting. We can grab the `x` column using the index of the column or the column name ("`carb`")

```
df[, 11]
```

```
 [1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
```

```
df[, "carb"]
```

```
 [1] 4 4 1 1 2 1 4 2 2 4 4 3 3 3 4 4 4 1 2 1 1 2 2 4 2 1 2 2 4 6 8 2
```

Biggest difference between `tbl` and `data.frame`:

Mostly, `tbl` (tibbles) are the same as `data.frame`s, except they don't print all lines. When subsetting only one column using brackets, a `data.frame` will return a vector, but a `tbl` will return a `tbl`

```
df[, 1]
```

```
 [1] 21.0 21.0 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 17.8 16.4 17.3 15.2
[15] 10.4 10.4 14.7 32.4 30.4 33.9 21.5 15.5 15.2 13.3 19.2 27.3 26.0 30.4
[29] 15.8 19.7 15.0 21.4
```

```
tbl[, 1]
```

```
# A tibble: 32 x 1
     mpg
   <dbl>
 1  21
 2  21
 3  22.8
 4  21.4
 5  18.7
 6  18.1
 7  14.3
```

Subset columns of a `data.frame`:

We can select multiple columns using multiple column names:

```
df[, c("mpg", "cyl")]
```

```
                   mpg cyl
Mazda RX4         21.0   6
Mazda RX4 Wag     21.0   6
Datsun 710        22.8   4
Hornet 4 Drive    21.4   6
Hornet Sportabout 18.7   8
Valiant           18.1   6
Duster 360        14.3   8
Merc 240D         24.4   4
Merc 230          22.8   4
Merc 280          19.2   6
Merc 280C         17.8   6
Merc 450SE        16.4   8
Merc 450SL        17.3   8
Merc 450SLC       15.2   8
Cadillac Fleetwood  10.4   8

Chrysler Imperial   14.7   8
Fiat 128          32.4   4
```

Subset columns of a `data.frame`: dplyr

The `select` command from `dplyr` allows you to subset

```
select(df, mpg)
```

```
                   mpg
Mazda RX4         21.0
Mazda RX4 Wag     21.0
Datsun 710        22.8
Hornet 4 Drive    21.4
Hornet Sportabout 18.7
Valiant           18.1
Duster 360        14.3
Merc 240D         24.4
Merc 230          22.8
Merc 280          19.2
Merc 280C         17.8
Merc 450SE        16.4
Merc 450SL        17.3
Merc 450SLC       15.2
Cadillac Fleetwood  10.4
Lincoln Continental 10.4
Chrysler Imperial   14.7
Fiat 128          32.4
```

Select columns of a `data.frame`: dplyr

The `select` command from `dplyr` allows you to subset columns of

```
select(df, mpg, cyl)
```

```
                   mpg cyl
Mazda RX4         21.0   6
Mazda RX4 Wag     21.0   6
Datsun 710        22.8   4
Hornet 4 Drive    21.4   6
Hornet Sportabout 18.7   8
Valiant           18.1   6
Duster 360        14.3   8
Merc 240D         24.4   4
Merc 230          22.8   4
Merc 280          19.2   6
Merc 280C         17.8   6
Merc 450SE        16.4   8
Merc 450SL        17.3   8
Merc 450SLC       15.2   8
Cadillac Fleetwood  10.4   8
Lincoln Continental 10.4   8
Chrysler Imperial   14.7   8
Fiat 128          32.4   4
```

Subsetting Rows

Subset rows of a `data.frame` with indices:

Let's select **rows** 1 and 3 from `df` using brackets:

```
df[ c(1, 3), ]
```

```
            mpg cyl disp  hp drat   wt  qsec vs am gear carb
Mazda RX4  21.0   6  160 110 3.90 2.62 16.46  0  1    4    4
Datsun 710 22.8   4  108  93 3.85 2.32 18.61  1  1    4    1
```

Subset rows of a `data.frame`: dplyr

The command in `dplyr` for subsetting rows is `filter`. Try `?filter`

```
filter(df, mpg > 20 | mpg < 14)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb
1  21.0   6 160.0 110 3.90 2.620 16.46  0  1    4    4
2  21.0   6 160.0 110 3.90 2.875 17.02  0  1    4    4
3  22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1
4  21.4   6 258.0 110 3.08 3.215 19.44  1  0    3    1
5  24.4   4 146.7  62 3.69 3.190 20.00  1  0    4    2
6  22.8   4 140.8  95 3.92 3.150 22.90  1  0    4    2
7  10.4   8 472.0 205 2.93 5.250 17.98  0  0    3    4
8  10.4   8 460.0 215 3.00 5.424 17.82  0  0    3    4
9  32.4   4  78.7  66 4.08 2.200 19.47  1  1    4    1
10 30.4   4  75.7  52 4.93 1.615 18.52  1  1    4    2
11 33.9   4  71.1  65 4.22 1.835 19.90  1  1    4    1
12 21.5   4 120.1  97 3.70 2.465 20.01  1  0    3    1
13 13.3   8 350.0 245 3.73 3.840 15.41  0  0    3    4
14 27.3   4  79.0  66 4.08 1.935 18.90  1  1    4    1
15 26.0   4 120.3  91 4.43 2.140 16.70  0  1    5    2
16 30.4   4  95.1 113 3.77 1.513 16.90  1  1    5    2
17 21.4   4 121.0 109 4.11 2.780 18.60  1  1    4    2
```

Subset rows of a `data.frame`: dplyr

By default, you can separate conditions by commas, and `filter` assumes these statements are joined by `&`

```
filter(df, mpg > 20 & cyl == 4)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb
1  22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1
2  24.4   4 146.7  62 3.69 3.190 20.00  1  0    4    2
3  22.8   4 140.8  95 3.92 3.150 22.90  1  0    4    2
4  32.4   4  78.7  66 4.08 2.200 19.47  1  1    4    1
5  30.4   4  75.7  52 4.93 1.615 18.52  1  1    4    2
6  33.9   4  71.1  65 4.22 1.835 19.90  1  1    4    1
7  21.5   4 120.1  97 3.70 2.465 20.01  1  0    3    1
8  27.3   4  79.0  66 4.08 1.935 18.90  1  1    4    1
9  26.0   4 120.3  91 4.43 2.140 16.70  0  1    5    2
10 30.4   4  95.1 113 3.77 1.513 16.90  1  1    5    2
11 21.4   4 121.0 109 4.11 2.780 18.60  1  1    4    2
```

```
filter(df, mpg > 20, cyl == 4)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb
1  22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1
```

Lab Part 3

Website

Combining `filter` and `select`

You can combine `filter` and `select` to subset the rows and columns, respectively, of a `data.frame`:

```
select(filter(df, mpg > 20 & cyl == 4), cyl, hp)
```

```
   cyl  hp
1    4  93
2    4  62
3    4  95
4    4  66
5    4  52
6    4  65
7    4  97
8    4  66
9    4  91
10   4 113
11   4 109
```

In `R`, the common way to perform multiple operations is to wrap functions around each other in a nested way such as above

Assigning Temporary Objects

One can also create temporary objects and reassign them:

```
df2 = filter(df, mpg > 20 & cyl == 4)
df2 = select(df2, cyl, hp)
```

Using the `pipe` (comes with `dplyr`):

Recently, the pipe `%>%` makes things such as this much more readable. It reads left side "pipes" into right side. RStudio `CMD/Ctrl + Shift + M` shortcut. Pipe `df` into `filter`, then pipe that into `select`:

```
df %>% filter(mpg > 20 & cyl == 4) %>% select(cyl, hp)
```

```
   cyl  hp
1    4  93
2    4  62
3    4  95
4    4  66
5    4  52
6    4  65
7    4  97
8    4  66
9    4  91
10   4 113
11   4 109
```

Adding/Removing Columns

Adding new columns to a `data.frame`: base R

You can add a new column, called `newcol` to `df`, using the `$` operator:

```
df$newcol = df$wt/2.2
head(df,3)
```

```
                mpg cyl disp  hp drat    wt  qsec vs am gear carb   newcol
Mazda RX4      21.0   6  160 110 3.90 2.620 16.46  0  1    4    4 1.190909
Mazda RX4 Wag 21.0   6  160 110 3.90 2.875 17.02  0  1    4    4 1.306818
Datsun 710     22.8   4  108  93 3.85 2.320 18.61  1  1    4    1 1.054545
```

Adding columns to a `data.frame`: dplyr

The `$` method is very common.

The `mutate` function in `dplyr` allows you to add or replace columns of a `data.frame`:

```
df = mutate(df, newcol = wt/2.2)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb    newcol
1  21.0   6 160.0 110 3.90 2.620 16.46  0  1    4    4 1.1909091
2  21.0   6 160.0 110 3.90 2.875 17.02  0  1    4    4 1.3068182
3  22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1 1.0545455
4  21.4   6 258.0 110 3.08 3.215 19.44  1  0    3    1 1.4613636
5  18.7   8 360.0 175 3.15 3.440 17.02  0  0    3    2 1.5636364
6  18.1   6 225.0 105 2.76 3.460 20.22  1  0    3    1 1.5727273
7  14.3   8 360.0 245 3.21 3.570 15.84  0  0    3    4 1.6227273
8  24.4   4 146.7  62 3.69 3.190 20.00  1  0    4    2 1.4500000
9  22.8   4 140.8  95 3.92 3.150 22.90  1  0    4    2 1.4318182

14 15.2   8 275.8 180 3.07 3.780 18.00  0  0    3    3 1.7181818
```

Removing columns to a `data.frame`: base R

You can remove a column by assigning to `NULL`:

```
df$newcol = NULL
```

Removing columns to a `data.frame`: dplyr

The `NULL` method is still very common.

The `select` function can remove a column with a minus (`-`), much like removing rows:

```
select(df, -newcol)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb
1  21.0   6 160.0 110 3.90 2.620 16.46  0  1    4    4
2  21.0   6 160.0 110 3.90 2.875 17.02  0  1    4    4

```

Ordering columns

Ordering the columns of a `data.frame`: dplyr

The `select` function can reorder columns. Put `newcol` first, then select the rest of columns:

```
select(df, newcol, everything())
```

```
      newcol  mpg cyl  disp  hp drat    wt  qsec vs am gear carb
1  1.1909091 21.0   6 160.0 110 3.90 2.620 16.46  0  1    4    4
2  1.3068182 21.0   6 160.0 110 3.90 2.875 17.02  0  1    4    4
3  1.0545455 22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1
4  1.4613636 21.4   6 258.0 110 3.08 3.215 19.44  1  0    3    1
5  1.5636364 18.7   8 360.0 175 3.15 3.440 17.02  0  0    3    2
6  1.5727273 18.1   6 225.0 105 2.76 3.460 20.22  1  0    3    1
7  1.6227273 14.3   8 360.0 245 3.21 3.570 15.84  0  0    3    4
8  1.4500000 24.4   4 146.7  62 3.69 3.190 20.00  1  0    4    2
9  1.4318182 22.8   4 140.8  95 3.92 3.150 22.90  1  0    4    2
10 1.5636364 19.2   6 167.6 123 3.92 3.440 18.30  1  0    4    4
11 1.5636364 17.8   6 167.6 123 3.92 3.440 18.90  1  0    4    4
12 1.8500000 16.4   8 275.8 180 3.07 4.070 17.40  0  0    3    3

```

Ordering rows

Ordering the rows of a `data.frame`: dplyr

The `arrange` function can reorder rows By default, `arrange` orders in ascending order:

```
arrange(df, mpg)
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb    newcol
1  10.4   8 472.0 205 2.93 5.250 17.98  0  0    3    4 2.3863636
2  10.4   8 460.0 215 3.00 5.424 17.82  0  0    3    4 2.4654545
3  13.3   8 350.0 245 3.73 3.840 15.41  0  0    3    4 1.7454545
4  14.3   8 360.0 245 3.21 3.570 15.84  0  0    3    4 1.6227273
5  14.7   8 440.0 230 3.23 5.345 17.42  0  0    3    4 2.4295455
6  15.0   8 301.0 335 3.54 3.570 14.60  0  1    5    8 1.6227273
7  15.2   8 275.8 180 3.07 3.780 18.00  0  0    3    3 1.7181818
8  15.2   8 304.0 150 3.15 3.435 17.30  0  0    3    2 1.5613636
9  15.5   8 318.0 150 2.76 3.520 16.87  0  0    3    2 1.6000000
10 15.8   8 351.0 264 4.22 3.170 14.50  0  1    5    4 1.4409091
11 16.4   8 275.8 180 3.07 4.070 17.40  0  0    3    3 1.8500000
12 17.3   8 275.8 180 3.07 3.730 17.60  0  0    3    3 1.6954545
13 17.8   6 167.6 123 3.92 3.440 18.90  1  0    4    4 1.5636364
14 18.1   6 225.0 105 2.76 3.460 20.22  1  0    3    1 1.5727273
15 18.7   8 360.0 175 3.15 3.440 17.02  0  0    3    2 1.5636364
16 19.2   6 167.6 123 3.92 3.440 18.30  1  0    4    4 1.5636364
17 19.2   8 400.0 175 3.08 3.845 17.05  0  0    3    2 1.7477273
```

Ordering the rows of a `data.frame`: dplyr

Use the `desc` to arrange the rows in descending order:

```
arrange(df, desc(mpg))
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb    newcol
1  33.9   4  71.1  65 4.22 1.835 19.90  1  1    4    1 0.8340909
2  32.4   4  78.7  66 4.08 2.200 19.47  1  1    4    1 1.0000000
3  30.4   4  75.7  52 4.93 1.615 18.52  1  1    4    2 0.7340909
4  30.4   4  95.1 113 3.77 1.513 16.90  1  1    5    2 0.6877273
5  27.3   4  79.0  66 4.08 1.935 18.90  1  1    4    1 0.8795455
6  26.0   4 120.3  91 4.43 2.140 16.70  0  1    5    2 0.9727273
7  24.4   4 146.7  62 3.69 3.190 20.00  1  0    4    2 1.4500000
8  22.8   4 108.0  93 3.85 2.320 18.61  1  1    4    1 1.0545455
9  22.8   4 140.8  95 3.92 3.150 22.90  1  0    4    2 1.4318182
10 21.5   4 120.1  97 3.70 2.465 20.01  1  0    3    1 1.1204545
11 21.4   6 258.0 110 3.08 3.215 19.44  1  0    3    1 1.4613636
12 21.4   4 121.0 109 4.11 2.780 18.60  1  1    4    2 1.2636364
13 21.0   6 160.0 110 3.90 2.620 16.46  0  1    4    4 1.1909091
14 21.0   6 160.0 110 3.90 2.875 17.02  0  1    4    4 1.3068182
15 19.7   6 145.0 175 3.62 2.770 15.50  0  1    5    6 1.2590909
16 19.2   6 167.6 123 3.92 3.440 18.30  1  0    4    4 1.5636364
17 19.2   8 400.0 175 3.08 3.845 17.05  0  0    3    2 1.7477273
18 18.7   8 360.0 175 3.15 3.440 17.02  0  0    3    2 1.5636364
```

Ordering the rows of a `data.frame`: dplyr

It is a bit more straightforward to mix increasing and decreasing orderings:

```
arrange(df, mpg, desc(hp))
```

```
    mpg cyl  disp  hp drat    wt  qsec vs am gear carb    newcol
1  10.4   8 460.0 215 3.00 5.424 17.82  0  0    3    4 2.4654545
2  10.4   8 472.0 205 2.93 5.250 17.98  0  0    3    4 2.3863636
3  13.3   8 350.0 245 3.73 3.840 15.41  0  0    3    4 1.7454545
4  14.3   8 360.0 245 3.21 3.570 15.84  0  0    3    4 1.6227273
5  14.7   8 440.0 230 3.23 5.345 17.42  0  0    3    4 2.4295455
6  15.0   8 301.0 335 3.54 3.570 14.60  0  1    5    8 1.6227273
7  15.2   8 275.8 180 3.07 3.780 18.00  0  0    3    3 1.7181818
8  15.2   8 304.0 150 3.15 3.435 17.30  0  0    3    2 1.5613636
9  15.5   8 318.0 150 2.76 3.520 16.87  0  0    3    2 1.6000000
10 15.8   8 351.0 264 4.22 3.170 14.50  0  1    5    4 1.4409091
11 16.4   8 275.8 180 3.07 4.070 17.40  0  0    3    3 1.8500000
12 17.3   8 275.8 180 3.07 3.730 17.60  0  0    3    3 1.6954545
13 17.8   6 167.6 123 3.92 3.440 18.90  1  0    4    4 1.5636364
14 18.1   6 225.0 105 2.76 3.460 20.22  1  0    3    1 1.5727273

Transmutation

The `transmute` function in `dplyr` combines both the `mutate` and `select` functions. One can create new columns and keep the only the columns wanted:

```
transmute(df, newcol2 = wt/2.2, mpg, hp)
```

```
     newcol2  mpg  hp
1  1.1909091 21.0 110
2  1.3068182 21.0 110
3  1.0545455 22.8  93
4  1.4613636 21.4 110
5  1.5636364 18.7 175
6  1.5727273 18.1 105
7  1.6227273 14.3 245
8  1.4500000 24.4  62
9  1.4318182 22.8  95
10 1.5636364 19.2 123
11 1.5636364 17.8 123
12 1.8500000 16.4 180
13 1.6954545 17.3 180
14 1.7181818 15.2 180
15 2.3863636 10.4 205
16 2.4654545 10.4 215
```
